**ATTENTION: Coastal and Environmental Engineers, Architects, Coastal Developers, Resort Owners, Government, Researchers, Graduate Students, Fishing and Community Groups**

*We can help you meet your environmental obligations to avoid or minimize impacts, restore biodiversity or create environmental offsets.*

It is time for *'better design below the waterline'* when it comes to coastal developments.

There is a growing trend to consider sustainable design, energy efficiency and reduced environmental impact. Canal estates, jetties, breakwaters, marinas and resorts can all benefit.

Developments/structures are incorporating innovative environmental features above the waterline, but what about below the waterline?

It is possible to build seawalls, canal walls, breakwaters, jetties, or ports that work with the environment and help you and your clients capitalise on the subtidal real estate, offset impacts from dredging or other construction activities, or add unique selling points to your developments for little or no additional cost. In some cases 'better' design is essential in order to obtain government approvals.

Reef Ball Australia will work with you to make a positive difference in coastal design. Call me direct to discuss your needs.
